

Coding & Solution

AI-Assisted Smart Budget Planner

Solution Summary

Field	Details
Repository Link / URL	https://github.com/Swetha-pocketAI/PocketSmartAI/tree/main/PocketSmart-AI-VSCode/pocketsmart
Programming Language(s)	Python, JavaScript, HTML, CSS
Framework(s) Used	FastAPI, Uvicorn
Key Features Implemented	Authentication; Home/Party/Jewelry planners; budget-cap packing; optional Jewelry image validation; history; optional Gemini commentary; tests.
Pending / Incomplete Features	Live merchant price verification is not implemented; catalog values are illustrative sample INR figures.
Setup / Run Instructions	Create venv, install requirements, configure .env, run `python -m uvicorn app.main:app --reload`, open http://127.0.0.1:8000 .

Code Quality Checklist

S.No	Criteria	PocketSmart AI
1	Modular functions / classes	Yes — app modules separate auth, database, models, planner, Gemini and main application.
2	Meaningful names	Yes — modules and planner functions are purpose-oriented.
3	Comments / documentation	Documented project report and source README are included.
4	Error handling	Gemini fallback and validation behavior are documented.
5	Runs without critical errors	Project report documents a runnable FastAPI application and test command.
